

SHEET FOUR - SUSPENSION

Suspension supports the vehicle on the road. For cars, it helps keep the rubber on the road. Control arms and spring support the vehicle. Wheels and axles connect the vehicle to the road. Working together traction is optimized while keeping the ride comfortable.

The suspension on your dragster is not as complicated. It consists of wheels, axles and a bearing surface to reduce friction. There are many combinations of wheels, axles and bearings that can be used. As you will learn, each combination will have its own performance characteristics.
